

Mason Gallo

Instructor

COURSE

PRE-WORK

IF YOU HAVEN'T ALREADY...

• Read the README:

https://github.com/MasonGallo/sql-bootcamp

Pay particular attention to the cheatsheet and exercises

OPENING

GETTING STARTED

WHO AM I

- Data Scientist
- Open Source Contributor
- ML Researcher Educational Technology
- Data Science Instructor @ GA

MY PHILOSOPHY

- If you're not sure, please ask!
- Be considerate of your fellow students
- Participate!!!
- NO ONE knows everything
- Anything worth knowing is hard
- Examples then theory
- Breaks

LEARNING OBJECTIVES

- Build a personalized roadmap for your career next steps with SQL
- Learn enough SQL to effectively query data from a single table
- Learn enough SQL to effectively query data from multiple tables
- Proficiency in importing/exporting data for your work

AGENDA

- Installation
- Databases 101
- Basic queries
- Aggregation
- Joins
- Next steps for your career / Personal plan

WHY ARE YOU HERE?

- New skills?
- New careers?

HELP ME ADAPT THE CURRICULUM TO YOU!

INSTALLATION

DOWNLOAD CLASS MATERIALS

All materials are available*** HERE
 Click "Clone or Download" -> "Download Zip"

Slides are available in the main directory with filename sql_bootcamp.pdf

***If you know git, you can always clone the repo

INSTALLATION

If for some reason you're not using the recommended installation, please raise your hand!

GET ACQUAINTED

- Take a few minutes to get acquainted
- Look for some common buttons you might need:
 - Run
 - Open
 - Import
 - Export

GETTING HELP

- How do you know where to get help?
- Is Googling cheating?
- How do I remember all this stuff?

DATABASES 101

YOUR THOUGHTS

How do you store your data? At work? Personal?

WHAT ARE THE OPTIONS

• Storing in a raw text file

Storing in excel or google sheets

MY THOUGHTS

Excel just won't cut it here...

- Storing social performance for many brands over several years

- Ad campaign with billions of impressions per month

LIMITATIONS

- Slow and inefficient
- Hard to share with coworkers
- Difficult to use with other applications
- Doesn't scale (millions? billions?)

WHAT DO WE WANT

- A methodology that can be used by many people and machines
- Scalability
- Speed
- Safety

WHAT DO WE WANT

Databases are a **structured** data source optimized for efficient **retrieval** and **storage**

WHAT IS SQL?

SQL (Structured Query Language) is a query language designed to Extract, Transform, Load data in relational databases

WHO USES SQL?

Web Developers

Data Analysts

Data Scientists

Product Managers

Statisticians

System Administrators

Backend Developers

...And many more

THE TERMS NO ONE EXPLAINS

- Database: think of as a directory or folder of tables
- Table: a collection of related structured data, usually as rows / columns
- Record: SQL lingo for "row"
- Field: SQL lingo for "column"
- Localhost: this computer (ie the computer you're using)
- Root: a user with FULL permission to do virtually anything
- UTF-8: capable of encoding all unicode characters

A database is software that's good at storing lots of data

Database vs. Spreadsheet

- Many people can use it
- Fast for lots of data
 (1M, 1B, or 1T rows!)
- It's always on
- The source of truth
- Good for complicated analysis

SQL is the language used to extract data from databases

- Code uses SQL to get data
- People use SQL to get data
 - Analytics
 - Operations
 - o others?

Databases live on computers

- Cloud (e.g. Amazon)
- Your data center
- Local (your computer)

MOTIVATING EXERCISE 1

Everyone together!

select *

from box_office

where movie_name = 'Toy Story 3';

Databases are organized

- Databases have tables
- Tables have columns
- Columns have types
 (e.g. date, number, text)

* means all columns
select *
from box_office table

where movie name = 'Toy Story 3';

select

where movie name = 'Toy Story 3';

What just happened??

```
select
  full_date,
  sales
from box_office
where movie_name = 'Toy Story 3';
```

movie_name	full_date	sales	day_of_month	month_of_year	year	genre_id
The Twilight Saga: New Moon	11/21/2009	42,288,881	21	11	2009	2
Transformers: Age of Extinction	6/27/2014	41,868,135	27	6	2014	1
The Twilight Saga: Breaking Dawn - Part 2	11/17/2012	41,443,147	17	11	2012	2
Toy Story 3	6/18/2010	41,148,961	18	6	2010	2
The Hunger Games: Mockingjay - Part 1	11/22/2014	40,905,873	22	11	2014	2
Alice in Wonderland	3/5/2010	40,804,962	5	3	2010	2
Star Wars: Episode III - Revenge of the Sith	5/21/2005	40,693,760	21	5	2005	1

What just happened?

```
select
  full_date,
  sales
from box_office
where movie_name = 'Toy Story 3';
```

movie_name	full_date	sales	day_of_month	month_of_year	year	genre_id
The Twilight Saga: New Moon	11/21/2009	42,288,881	21	11	2009	2
Transformers: Age of Extinction	6/27/2014	41,868,135	27	6	2014	1
The Twilight Saga: Breaking Dawn - Part 2	11/17/2012	41.443.147	17	11	2012	2
Toy Story 3	6/18/2010	41,148,961	18	6	2010	2
The Hunger Games: Mockingjay - Part 1	11/22/2014		22		2014	2
Alice in Wonderland	3/5/2010	40,804,962	5	3	2010	2
Star Wars: Episode III - Revenge of the Sith	5/21/2005	40,693,760	21	5	2005	1

```
select full_date, sales
from box_office
where movie_name = 'Toy Story 3';
```

- Graph sales over time for Dead Poets Society
- Graph sales over time for your favorite movie

MOTIVATING EXERCISE 2

```
select
    movie name,
    full date,
    sales
from box office
where movie name like 'Toy Story%';
```

Operators

Text:

```
= equals
```

```
!= not equal
```

```
like `%' matches any sequence of zero or more characters
e.g. `%wag%' matches "wagon", "swag", "swagger", etc.
```

ilike is the same as like, but is case insensitive

matches regular expressions

```
in included in a list, e.g. movie_name in ('Titanic', 'Toy Story')
    matches Titanic and Toy Story
```

 Graph box office sales for all movies that include the word "good" (case insensitive)

hint: use the ilike operator

```
select *
from box_office
where sales > 40000000;
```

Operators

Numbers:

- < less than
- > greater than
- <= less than or equal to
- >= greater than or equal to
- = equal
- != not equal

```
select
  full date,
  sales
from box office
where full date > '01/01/2005';
```

Operators

Date:

- < before
- > after
- <= before or same date</pre>
- >= after or same date
- = equal
- != not equal

```
select
  movie name,
  full date,
  sales
from box office
where
 movie name = 'Forrest Gump'
 and full date < '01/01/2000';
```

```
select
  movie_name, full_date, sales
from box_office
where
  movie_name = 'Forrest Gump'
  and full_date < '01/01/2000';</pre>
```

- 1. "Titanic" was re-released in 2012 (why?). Graph sales for the original release only.
- 2. Select the days that "Inception" had sales of \$10 million or more

SQL BOOTCAMP

BASIC QUERIES

NOTE BEFORE WE GET STARTED

Capitalization doesn't matter (SQL isn't case-sensitive)

SQL ignores whitespace (but don't go crazy)

• Be OCD about your punctuation (it matters!)

SELECT *
FROM users

Return all rows from all columns

SELECT title, first_name, last_name

FROM users

Return all rows from specific columns

SELECT DISTINCT title, first_name, last_name
FROM users

Return unique rows from the specified columns

SELECT *

FROM users

WHERE < condition>

Return all columns under a specified condition

SELECT *

FROM users

WHERE state = "arizona"

SELECT *

FROM users

WHERE state LIKE "arizona"

AND title LIKE "Miss"

SELECT *
FROM users
WHERE state IN
("arizona", "florida")

SELECT *

FROM users

WHERE state IN

("arizona", "florida")

What happens if we put a NOT in front of IN?

SELECT *

FROM users

WHERE zip = 10007

Notice the use of = here instead of LIKE. Any ideas?

We can also use >, <, !=, >=, <=

SELECT *

FROM users

WHERE street LIKE "%rd"

% matches anything

_ matches a single character

SELECT *

FROM users

WHERE street LIKE "%rd"

ORDER BY first_name

What happens if you put DESC after first_name?

SELECT *

FROM users

WHERE street LIKE "%rd"

ORDER BY first_name

LIMIT 5

What does LIMIT do?

YOUR TURN

Complete the warm up exercises <u>here</u>

SQL BOOTCAMP

MOTIVATING EXERCISE 3

ORDER BY

```
select
  full_date,
  sales
from box_office
where movie_name = 'Toy Story 3'
order by full_date asc;
```

- Comes after select, from, where, group by, having
- Can be ASC or DESC
- Default is ASC

LIMIT

select * from table limit 10; is the first query most people run!

- Comes after select, from, where, group by, having, order by
- Good way to quickly browse results

Find the top 10 highest grossing days of all time.

Hint: use order by desc & limit!

GROUP BY: aggregate many rows into 1

Example: select * from box office; movie name full date sales 1/1/1998 100 Titanic 1/2/1998 Titanic 200 1/3/1998 Titanic 300 Good Will Hunting 1/1/1998 200 Good Will Hunting 1/2/1998 200 Good Will Hunting 1/3/1998 500

Total Box Office sales per movie?

movie_name	full_date	sales		
Titanic	1/1/1998	100	4	600
Titanic	1/2/1998	200		
Titanic	1/3/1998	300		
Good Will Hunti	ing 1/1/1998	200	4	900
Good Will Hunti	ing 1/2/1998	200		
Good Will Hunti	ing 1/3/1998	500		

Total Box Office sales per movie?

```
select
  movie name,
  sum(sales)
from box office
group by movie name;
movie name
                sum
                600
Titanic
Good Will Hunting 900
```

```
select
  movie_name,
  sum(sales)
from box_office
group by movie_name;
```

What is the average sales per movie?

Hint: Use avg(column_name) instead

of sum(column_name)

Average Box Office sales per movie?

```
select
   movie name,
    sum(sales),
   avg(sales)
from box office
group by movie name;
```

Average Box Office sales per movie?

```
select
   movie name,
   sum(sales) as total sales,
   avg(sales) as avg_sales
from box office
group by movie name;
```

Total Box Office sales per month?

movie_name	month_of_yearsales		
Titanic	1	100	
Titanic	2	200	
Titanic	3	300	
Good Will Hunti	ing 1	200	
Good Will Hunti	ing 2	200	
Good Will Hunti	ing 3	500	

Total Box Office sales per month?

movie_name	month_of_yearsales		
Titanic	1	100	
Titanic	2	200	
Titanic	3	300	
Good Will Hunt:	ing 1	200	
Good Will Hunt:	ing 2	200	
Good Will Hunt:	ing 3	500	

Total Box Office sales per month?

movie_name	month_of_	yearsales
Titanic	1	100
Titanic	2	200
Titanic	3	300
Good Will Hunti	ing 1	200
Good Will Hunti	ing 2	200
Good Will Hunti	ing 3	500

Total Box Office sales per month?

```
select
    month_of_year,
    sum(sales) as total_sales
from box_office
group by month_of_year;
```

Total Box Office sales per month, per year?

month_of_year	total_sales	
10	2003	100
11	2003	200
12	2003	300
1	2004	200
2	2004	200
3	2004	500

Total Box Office sales per month, per year?

```
select
    month of year,
    year,
    sum(sales) as total sales
from box office
group by month of year, year
order by year, month of year;
```

```
select
  movie_name, sum(sales)
from box_office
group by movie name;
```

Find the avg of sales per month_of_year

Find & graph the total sales per day of month

 Find the sum of sales per day_of_month per month_of_year

SQL BOOTCAMP

AGGREGATION

YOUR TURN

What if we want to compute overall statistics about the data?

Think: we want counts, averages, etc

SELECT *
FROM users

Return all rows from columns

SELECT count(*)
FROM users

Return the count of all rows from all columns

SELECT distinct first_name FROM users

Return the unique first names

SELECT count(distinct first_name)
FROM users

Return the count of unique first names

SELECT avg(zip) FROM users Return the average zip code (yes, I know this doesn't make sense)

SELECT avg(zip) as "nonsense" FROM users

Rename our avg zip to "nonsense"

SELECT gender, avg(zip) as "nonsense"

What if we want to know the avg zip by gender?

FROM users

GROUP BY gender

We can use sum, avg, min, max, count

SELECT state, gender, avg(zip) as "nonsense"

What happened here?

FROM users

GROUP BY state, gender

SELECT state, gender, avg(zip) as "nonsense"

What happened here?

FROM users

GROUP BY state, gender

ORDER BY 1

SELECT state, gender, avg(zip) as "nonsense"

What happened here? Shorthand?

FROM users

GROUP BY state, gender

ORDER BY 1

What about where?

- Can still use where,
 comes before group by
- To conditionally include aggregates, use having

What about where?

```
select
   movie name,
   sum(sales)
from box office
group by movie name
having sum(sales) > 400000000;
```

Aggregate functions galore!

- avg(column_name)
- count(column_name)
- count(distinct column_name)
- sum(column_name)
- max(column_name)
- min(column_name)
- corr(col_A, col_B)
- many more!

```
select movie_name,sum(sales)
from box_office group by movie_name;
```

• Find the top 10 grossing movies of all time. (Hint: use order by, limit and group!)

- Calculate the release date of each movie.
 (hint: how can you express release date as an aggregate function of full_date?)
- Count how many days each movie was in theaters.

SELECT state, gender, avg(zip) as nonsense

FROM users

GROUP BY state, gender

HAVING nonsense > 50000

What happened here? What happens if we use WHERE instead?

SELECT <columns>
FROM

WHERE <condition>

GROUP BY <columns>
HAVING <condition on aggregates>

ORDER BY <columns>

LIMIT < number>

General SQL structure (putting it all together)

YOUR TURN

Complete the aggregation exercises <u>here</u>

SQL BOOTCAMP

MOTIVATING EXERCISE 4

Why join?

- Not all data stored in all tables
- Relationships exist between tables

Example: Box office sales by genre

```
select
    genres.genre name,
   box office.movie name,
   box office.full date,
    box office.sales
from box office
join genres on box_office.genre_id = genres.genre_id
where box_office.movie_name ilike '%new york%';
```

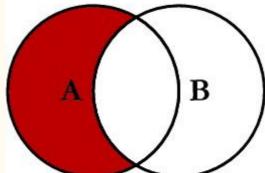

What if a movie doesn't have a genre_id?

```
select *
from box_office
where genre_id is null;
```

В

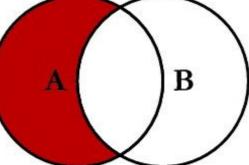

SQL JOINS

SELECT <select_list> FROM TableA A LEFT JOIN TableB B ON A.Key = B.Key

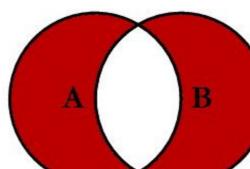

B A

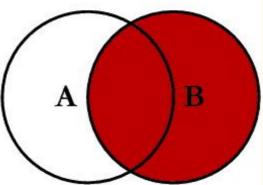

SELECT <select_list> FROM TableA A INNER JOIN TableB B ON A.Key = B.Key

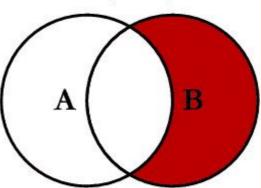

SELECT <select_list> FROM TableA A LEFT JOIN TableB B ON A.Key = B.KeyWHERE B.Key IS NULL

> SELECT <select_list> FROM TableA A FULL OUTER JOIN TableB B ON A.Key = B.Key

SELECT <select_list> FROM TableA A RIGHT JOIN TableB B ON A.Key = B.Key

SELECT <select_list> FROM TableA A RIGHT JOIN TableB B ON A.Key = B.KeyWHERE A.Key IS NULL

SELECT <select list> FROM TableA A FULL OUTER JOIN TableB B ON A.Key = B.KeyWHERE A.Key IS NULL OR B.Key IS NULL

B

```
select
    genres.genre name,
    box office.movie name,
    box office.full date,
    box office.sales
from box office
join genres
  on box office.genre id = genres.genre id;
```

 Use group by and join to find the sum of sales per genre_name

SQL BOOTCAMP

JOINS

What if we want to deal with multiple tables?

Think: we want to capture information from 2 or more tables simultaneously

Import flights.sql

A relational database is organized in the following manner:

A database has tables which represent individual entities or objects

 Tables have a predefined schema - rules that tell it what columns exist and what they look like

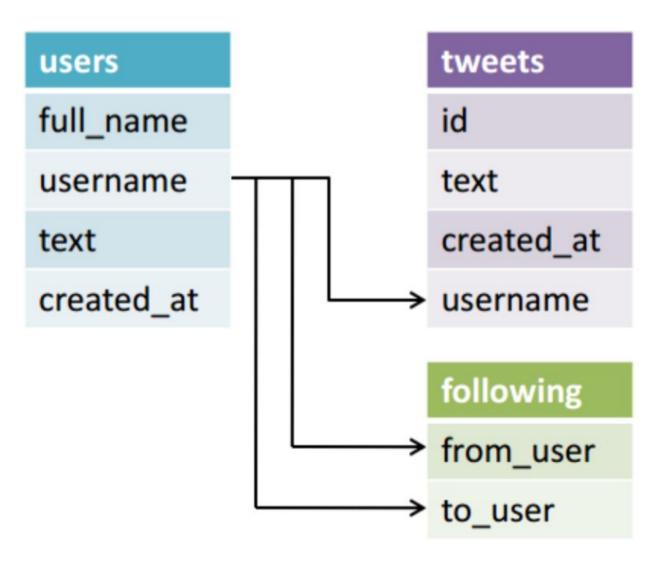

A relational database is organized in the following manner:

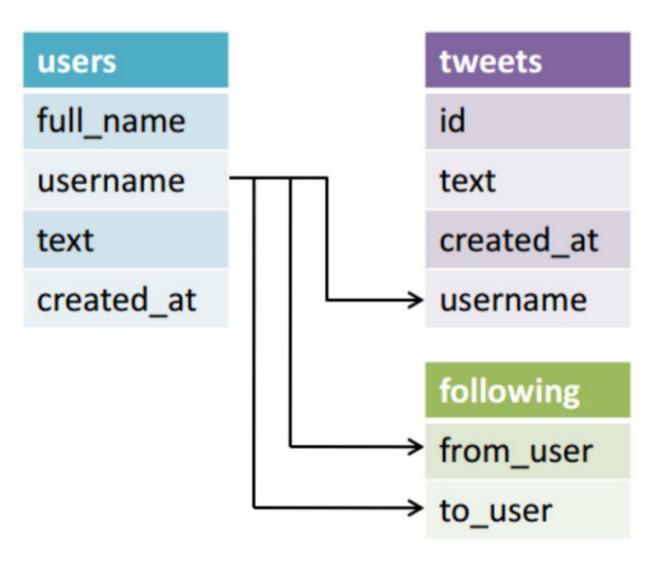

table

id	first name	last name	date of birth
312	Joe	Smith	1980-12-24
1532	Michelle	Anderson	1973-03-12

schema

```
id bigint
first_name char(36)
last_name char(36)
date_of_birth timestamp
```

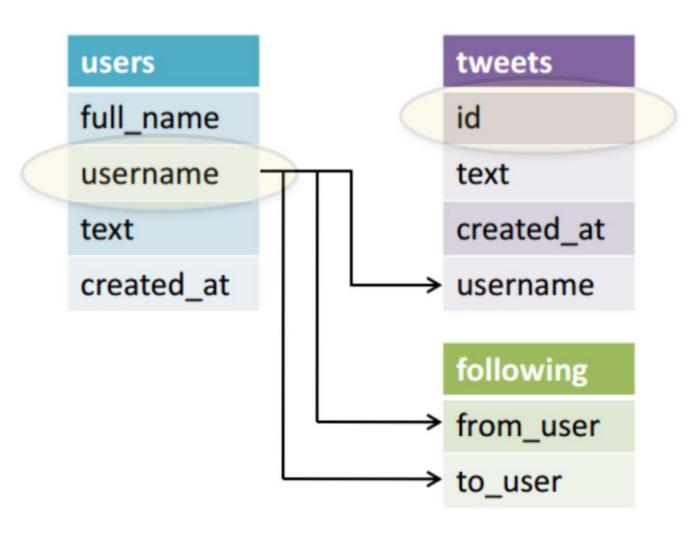

Each table should have a PRIMARY KEY

Think: a unique identifier for each row

Ex: SSN

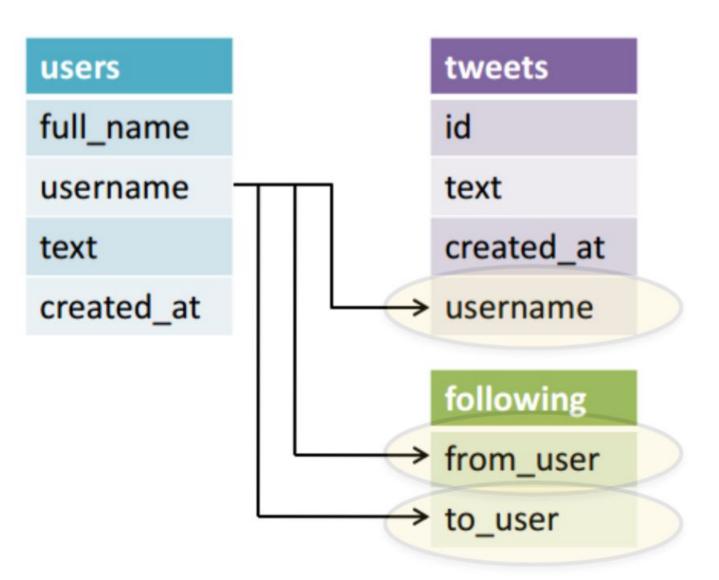

Each table should have a PRIMARY KEY

Think: a unique identifier for each row

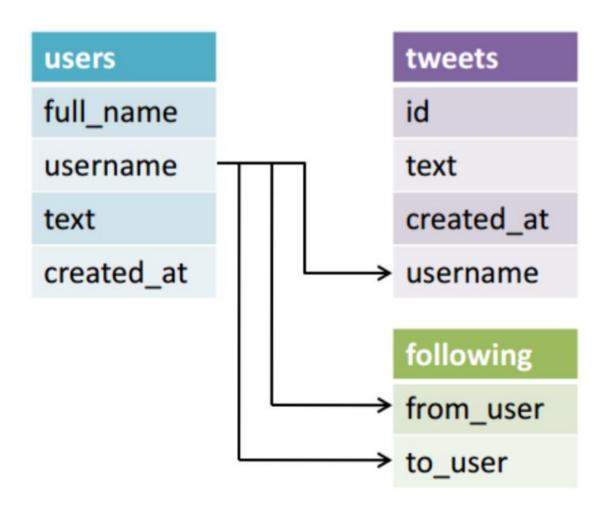

Ex: SSN

Additionally, each table may have a FOREIGN KEY

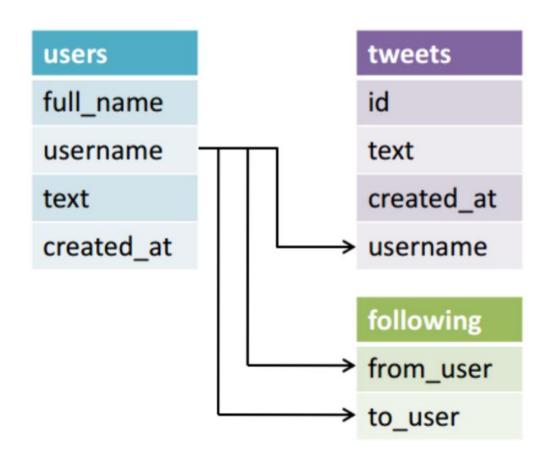

Think: an ID that links one table to another

Create a table with all the users' full names and their tweets

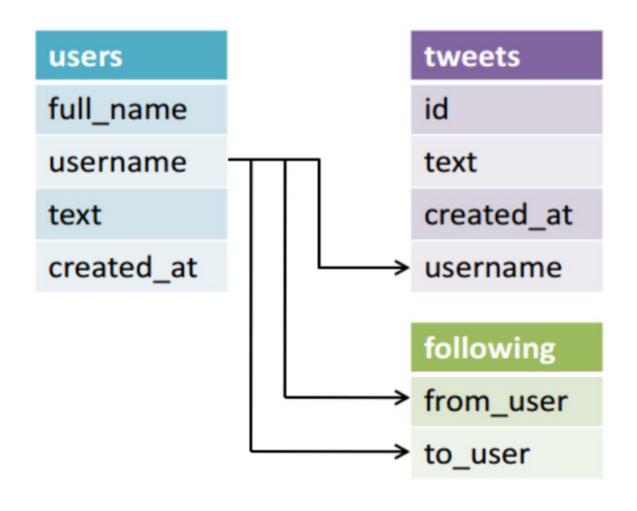

Create a table with all the users' full names and their tweets

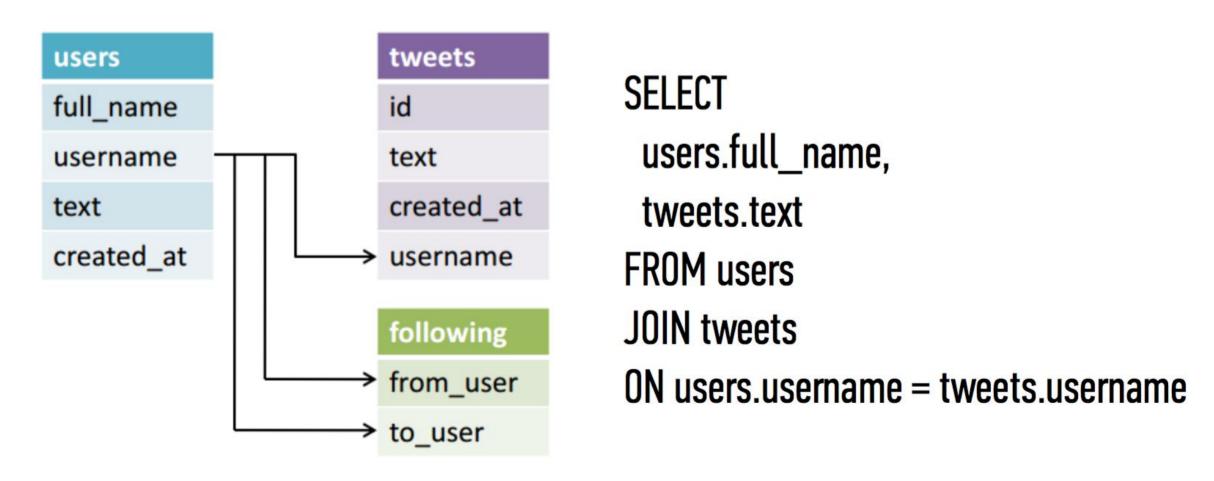

Create a table with all the users' full names and their tweets

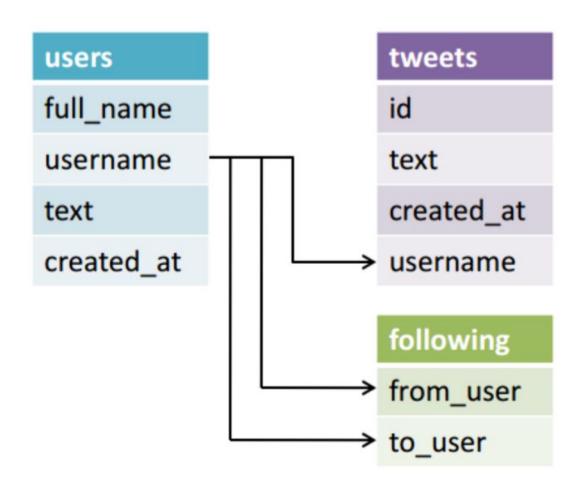

SELECT
users.full_name,
tweets.text

Create a table with all the users' full names and their tweets

Create a table with all the users' full names and their tweets

Will users who never tweeted appear in the list?

JOIN will only include entries that occur in both tables.

```
SELECT
full_name,
text
FROM users
JOIN tweets
ON users.username = tweets.username
```

full_name	tweet
Joe Smith	Hello, world!
Joe Smith	Just tweetin'
Michelle Ng	I am eating pizza tonight

LEFT JOIN will always include all entries from the <u>left</u> table, even if there are no matches in the other table.

SELECT

full_name,

text

FROM users

LEFT JOIN tweets

ON users.username = tweets.username

full_	name	tweet
_		

Joe Smith Hello, world!

Joe Smith Just tweetin'

Michelle Ng I am eating pizza tonight

Jim Rogers

FULL OUTER JOIN will always include all entries from <u>both</u> tables, even if there are no matches in the other table.

SELECT

full_name,

text

FROM users

FULL OUTER JOIN tweets

ON users.username = tweets.username

full_name	tweet
Joe Smith	Hello, world!
Joe Smith	Just tweetin'
Michelle Ng	I am eating pizza tonight
Jim Rogers	
	OK, deleting my account

The holes in the resulting table are called **NULL**s.

NULL indicates missing data.

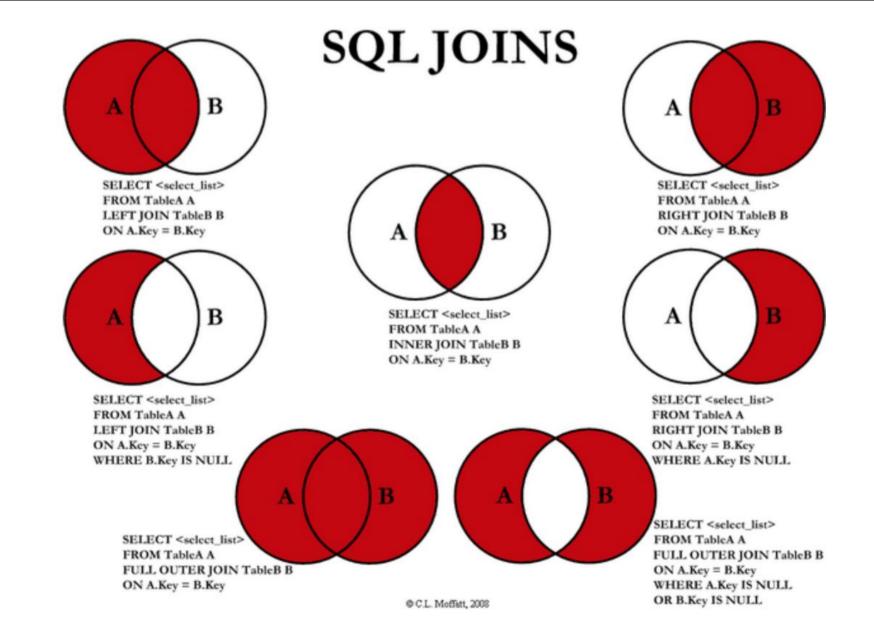

Note that **NULL** is not the same as zero or an empty string "", it really means that there is no data.

full_name	tweet	
Joe Smith	Hello, world!	
Joe Smith	Just tweetin'	
Michelle Ng	I am eating pizza tonight	
Jim Rogers NULL		
NULL	OK, deleting my account	

For example, to print a list of users without tweets, we'd write

SELECT full_name
FROM users
FULL OUTER JOIN tweets
ON users.username = tweets.username
WHERE tweets.text IS NULL

full_name
Jim Rogers

```
SELECT <columns>
FROM 
JOIN <otherTable>
ON <table.key> = <otherTable.key>
JOIN <yetAnotherTable>
ON <otherTable.key> = <yetAnotherTable.key>
```

General SQL structure

NOTE

You can combine as many **JOIN**s as you want!

```
SELECT <columns>
FROM 
[INNER|LEFT|RIGHT|FULL OUTER] JOIN <otherTable>
ON <table.key> = <otherTable.key>
WHERE <condition>
GROUP BY <columns>
HAVING < condition >
ORDER BY <columns> [DESC|ASC]
LIMIT < number>
```

General SQL structure

We could have had a table structure as follow:

Why is this different?

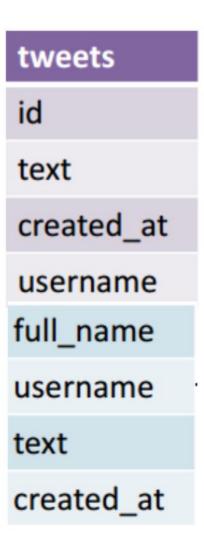

```
tweets
id
text
created_at
username
full_name
username
text
created_at
```

We could have had a table structure as follow:

Why is this different?

We would repeat the user information on each row.

This is called denormalization

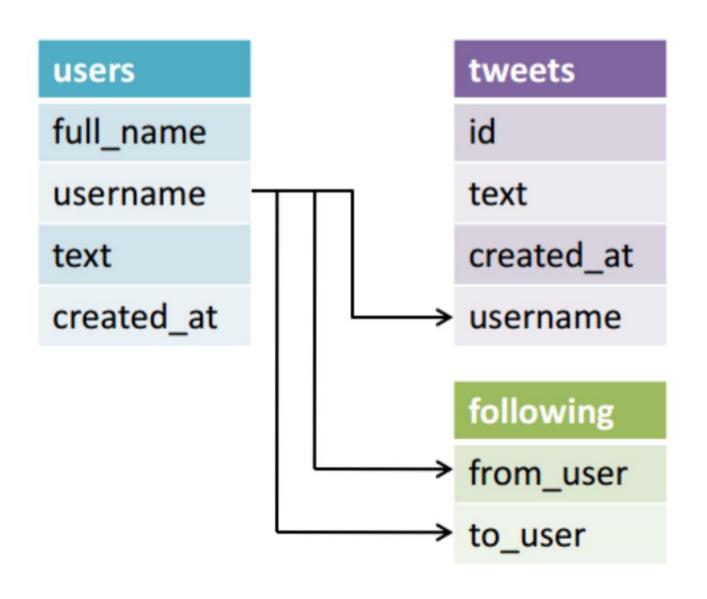

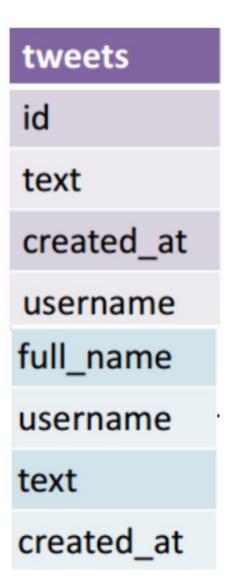

Normalized Data:

Many tables to reduce redundant or repeated data in a table

Denormalized Data:

Wide data, fields are often repeated but removes the need to join together multiple tables

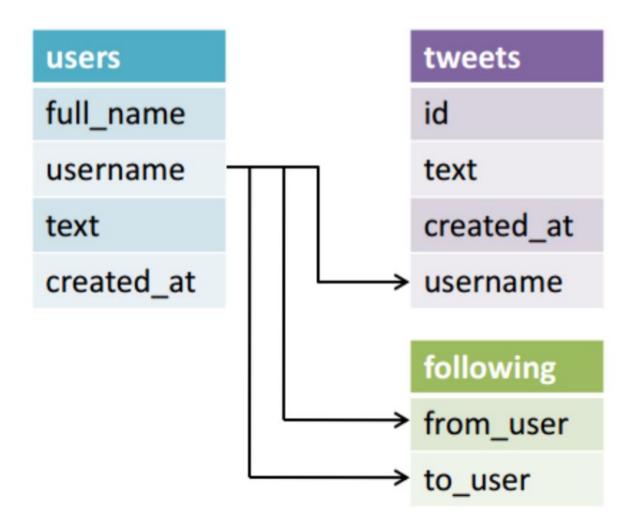

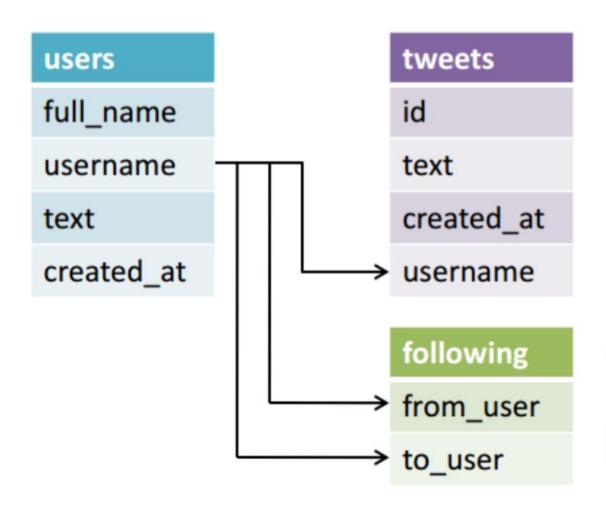

Q: How do we commonly evaluate databases?

- read-speed vs. write speed
- space considerations
- (...and many other criteria)

Q: Why are normalized tables (possibly) slower to read?

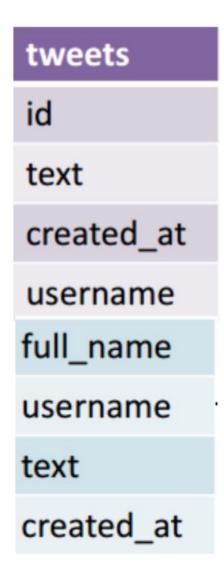

Q: Why are normalized tables (possibly) slower to read?

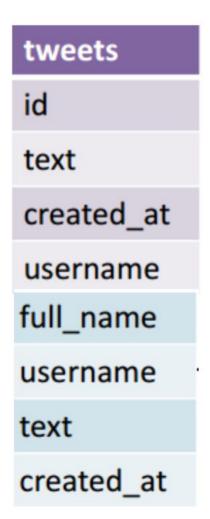

We'll have to get data from multiple tables to answer some questions

Q: Why are denormalized tables (possibly) slower to write?

Q: Why are denormalized tables (possibly) slower to write?

We'll have to write more data each time we store something

SQL BOOTCAMP

NEXT STEPS

NEXT STEPS FOR WEB DEVELOPERS

Install the **LAMP Stack**

You now know the M in LAMP!

Try creating a site and using SQL to store your data

NEXT STEPS FOR DATA ANALYSTS / DATA SCIENTISTS

Get a toy dataset

Use in conjunction with a data visualization tool like Excel or Tableau

Excel has **Power Query** and Tableau has native SQL support!

NEXT STEPS FOR BACKEND DEVELOPERS

Get a toy dataset and manipulate using your favorite scripting language, like Python (I'm biased!)

OPINION

Be weary of people telling you that SQL is "too slow" or "too fast"

Make sure they're not trying to sell you something!

OPINION

You should not be "cleaning" your data in SQL

You should not be "formatting" your data in SQL for visualization

SQL is only for storing and retrieving raw data!

OPINION

You now know probably 80% of the SQL you need

Many people will never need to use the remaining 20% EVER

Make sure your skills don't atrophy!
